How to deploy the site for upload and performance testing

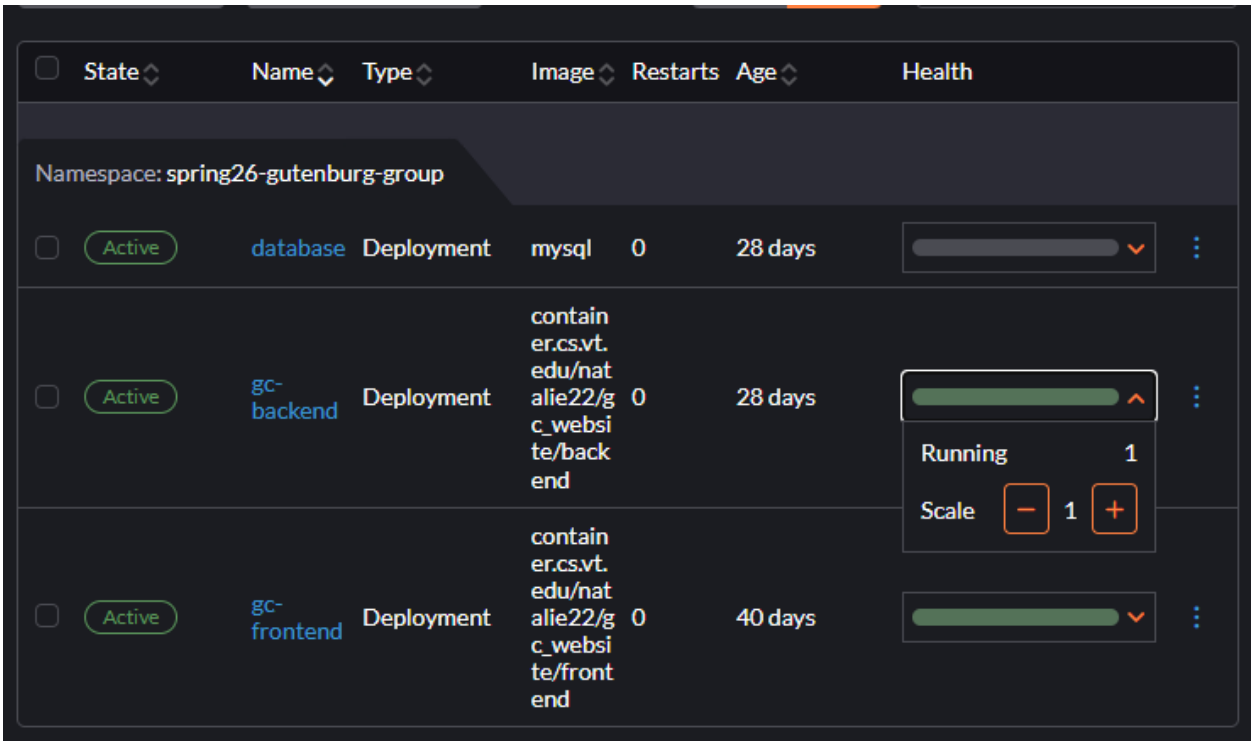

1. Go to this link and login https://launch.cs.vt.edu/dashboard/home
2. Click discovery

3. Click workloads

4. Set the scale to 0 for both the backend and frontend

5. Download and open docker desktop.

6. In VS Code run **docker login container.cs.vt.edu** and enter your CS username and password

7. I've created 2 files you can use to run all the docker commands you need to push the containers so run:

   Powershell: **.\build-and-push.ps1**

   Bash: **chmod +x build-and-push.sh**
   ./build-and-push.sh

8. Once the containers are pushed go back to the deployment site and set the scale back to 1 for the frontend and backend.
